

I have all the pics on my computer. I have tried to upload them to the server but it keeps telling me they are too big. I have a step-by-step to follow to get it working. Any help would be appreciated. A: In this tutorial, I am assuming that you have the photos in the

following folder:
D:\photos\ (I used this folder in the following step). Unzip the zip file to a temporary folder. Open File Explorer. You should see the unzipped folder. Right-click on the temporary folder. Select "Move..." Select the photo you want to move (the one you want to save, not

the one you downloaded). Select the new folder (the folder you created in step 1). Click on "Move". Now you should be able to see the photo in the folder that you created in step 1.

A: First you have to upload the photo to the server. But you can also try to compress it to be smaller. Uploading: There

are two ways of doing this. You can use a FTP program such as CyberDuck and upload it to the server. The easiest way to do this is probably via Firefox as it has an FTP feature built in. You can also do this with FileZilla or a similar program. Then there are two ways you can

compress it. You can upload it to the server but then compress it in your computer. I do this with Photoshop. I just choose save as and then select the image format I want. I will take this for example. I have a photo of my daughter and I want to save it for safe keeping. I'll save it as a PNG. I

then right-click on the image and select edit. I can then go down the little menu and select all at once. Then I right-click and click "save for web". I can then name it and hit save. Then it will appear in my downloads folder on the computer. If you want to resize it. I will for example just select the

image. Then I will go to "File". I will then choose "Image Size". I will choose "Image Width" and then the "Image Height". I then select the size I want it. You may have to zoom in and out to get it the way you want it. But the other way
